## FLU VACCINE UPTAKE AMONG PREGNANT MOTHERS

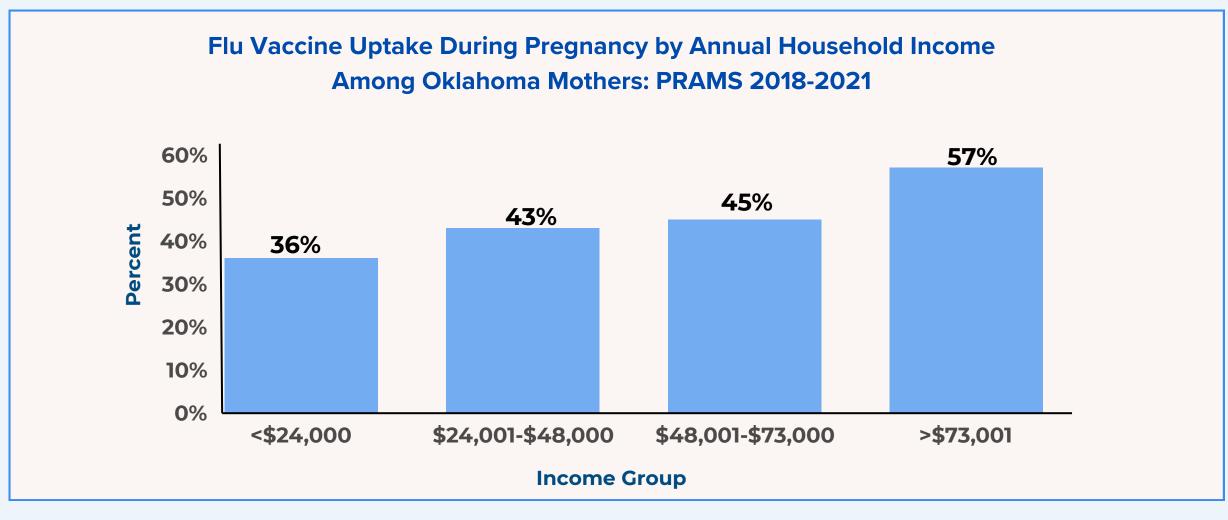

From Oklahoma 2018-2021 PRAMS

Receiving the flu vaccine can help protect both expecting mothers and babies. The antibodies generated by the mother will protect the baby against the flu until they can receive the vaccine at six months of age. Pregnant mothers and newborns are at higher risk of flu complications, so it is recommended that pregnant mothers receive the vaccine based on their physicians recommendations. The vaccine can greatly decrease a mother's chance of complications or hospitalizations from the flu.

43.5%

## of Oklahoma mothers received the flu vaccine during their pregnancy

PRAMS collects population-based data on maternal attitudes and experiences before, during, and shortly after pregnancy. Around 250 Oklahoma mothers are randomly selected monthly to participate and can respond by mail, phone, or web survey in English or Spanish. Information included in the birth registry is used to develop analysis weights that adjust for selection probability and non-response. Prevalence rates were calculated using SAS callable SUDAAN.

This issue used 2018-2021 PRAMS data. The response rate for 2018-2021 was 51%. 2020 data was suppressed due to its low response rate. Special assistance for this infographic was provided by April Lopez, MPH; Ayesha Lampkins, MPH; Binitha Kunnel, MS; and Rebekah Rodriguez.

Funding was made possible by PRAMS, grant number U01DP006591 and by the Maternal and Child Health Bureau, Department of Health and Human Services, Maternal and Child Health Services Title V Block Grant.

This publication was issued by the Oklahoma State Department of Health (OSDH), an equal opportunity employer and provider. A digital file has been deposited with the Publications Clearinghouse of the Oklahoma Department of Libraries in compliance with section 3-114 of Title 65 of the Oklahoma Statutes and is available for download at www.documents.ok.gov | Issued February 2024.
