Disclosures

- This work was funded by the National Science Foundation and US Department Agriculture. **Any opinions, findings, and conclusions are mine** and do not necessarily reflect the views of these federal agencies
- Most of this research was performed prior to the change in administration. **Practices around rulemaking are changing.**

FCC and Net Neutrality

- In 2017, the FCC solicited comments on a rule addressing neutrality in computer networks
- Over **25 million** comments were submitted

Opposition to Net Neutrality Was Faked, New Study Shows

By JON BRODWIN, ARS TECHNICA

SECURITY MAY 8, 2021 11:18 AM

ISPs Funded 8.5 Million Fake Comments to Oppose Net Neutrality

The secret campaign, backed by major broadband providers, used fake names to flood the FCC with comments opposing net neutrality.

Monkey Cage

Millions of fake commenters asked the FCC to end net neutrality. 'Astroturfing' is a business model.

The technology used this time may be new, but the practice has been around for decades

May 14, 2021

0

FCC and Net Neutrality

- Out of 25 million comments, **18 million were duplicates or faked**
- **Over 9 million** people had **names used to submit comments**
- Over **400,000 comments came from Russia**

- Federal and state investigations kicked off
- FCC repealed net neutrality anyway

Notice and Comment in Rulemaking

- In democratic governance, public participation in rulemaking is essential
 - Affected parties can express their interests and concerns
 - Information gathering mechanism for government in setting good rules
- Administrative Procedure Act (1946) allows citizens to comment on pending regulations and **obligates government** to respond to substantive issues
- Beginning in 1990's notice and comment activities **moved online** with a series of laws and executive orders

Notice and Comment in Rulemaking

- Motives in moving activities online:
 - Greater transparency
 - Reduction in cost
 - Greater access for citizens
 - Greater engagement between government and citizens
- Also created opening for **Opinion Spam**
 - Mass commenting initiatives
 - Computer-generated comments
 - Fake comments

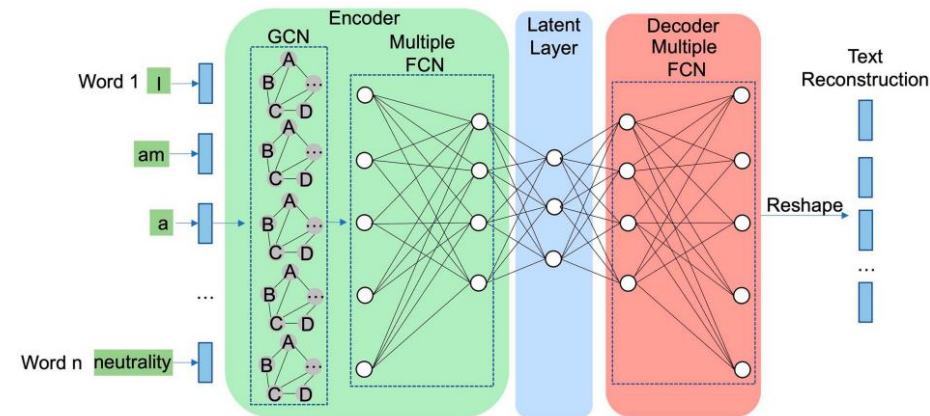

Research on Opinion Spam in Rulemaking

- Technical approaches to counter opinion spam
- Interviews with rulemakers from 6 federal agencies
 - Procedures for comment evaluation and response
 - How comments are used
 - Legitimacy of process
- Online experiments with ~1300 US citizens about rulemaking
 - Reactions to opinion spam
 - Attitudes about mitigation techniques
- Recommendations to address opinion spam

Technical Interventions

- Can we detect duplicate comments like those that flooded the FCC Net Neutrality docket?
 - Developed new techniques to detect duplicates that uses language structure and unsupervised machine learning
- **Detection accuracy > 90%** compared to 85-87% of existing methods

- **Generative AI (genAI) changed everything...**

GenAI Capabilities in Commenting

- It takes a couple minutes to create 10,000 unique comments using ChatGPT, Claude, and Gemini
- Built using templates, seed comments, or the documents agencies post to a docket
- Any length, with references or without, advocating any position with support and argument
- **Artificial comments appear more persuasive than human-generated comments from regulation.org**

GenAI Capabilities in Commenting

- **Detection and filtering is extremely challenging**
 - GenAI is too good at creating comments and detection algorithms lag
 - False positives in detection may filter legitimate comments from citizens
 - Detection and filtering has not undergone legal scrutiny
- GenAI can also aggregate and summarize themes in text
 - Develop models that identify, group, and summarize similar comments
 - Testing is ongoing as to the reliability of these techniques
 - Potential basis for automatic tagging for substantive content

Rulemaker Reactions

- **“Comments are not votes.”**
Comments are part of *information gathering that leads to good policy.*
- Evaluation of comments is typically manual, after rudimentary screening
- Opinion spam is most often ignored in rulemaking because it is not substantive or is duplicative

Rulemaker Reactions

Administrative Burden

- Large increase on comments on contentious issues
- Increase in evaluation resources resulting from opinion spam

Distorted Representation of Public Opinion

- Opinion spamming part of influence campaigns hoping to shape regulations
- Minimizing input from other important constituencies
- *Debate among agencies about size of this problem*

Rulemaker Reactions

Erosion of Trust

- Opinion spam threatens legitimacy of rulemaking process
- Appointees and elected officers want to know the numbers

Role of AI in Evaluating Comments

- Hesitancy about using AI, but a clear need for better tools
- AI may further undermine trust in regulatory process
- AI use has not undergone legal scrutiny
- *Debate among agencies about AI use*

Experimental Findings – Experiment 1

- We replicated regulations.gov and asked people to read about and comment on a fictitious pending regulation for gun control (ATF)
- For some people, we included opinion spam in the comments

Results

- Engaged people commented, regardless of duplicates, and became more confrontational
- Aware people (the vast majority) were discouraged by duplicated comments

Experimental Findings – Experiment 2

- We replicated regulations.gov and asked people to read about and comment on a fictitious pending regulation for gun control (ATF)
- For some people, we included opinion spam in the comments
- *We told people that AI, AI + agency employee, or agency employee evaluated the comments*

Results

- AI + agency employee generated the most control mutuality and trust

Experimental Findings – Experiment 3 + 4

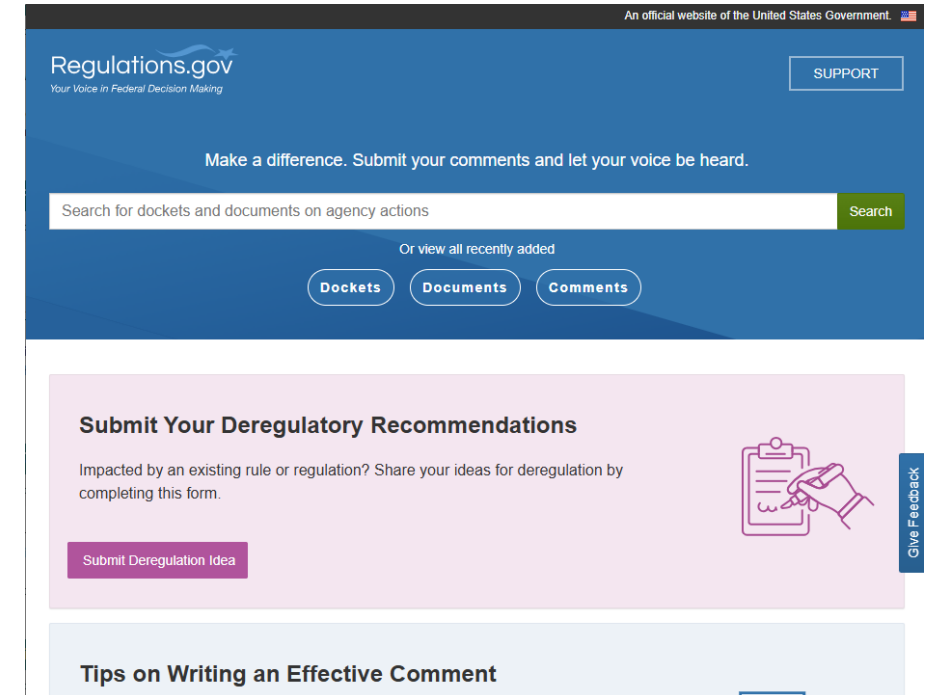

- Asked people to read about and comment on a fictitious pending regulation concerning immigration or transgender rights
- Opinion spam was evident in the comments
- We told people that AI, AI + agency employee, or agency employee evaluated the comments

Results

- Agencies garnered most trust when using employees for evaluation
- Those who had high social trust and trust in machines favored employee evaluation the most

Lessons for today...

- Federal agencies are very different today...
- Unclear what the role of public input is in rulemaking
- Agencies carry out the regulatory priorities of the White House
- **Underlying technical and social forces have not gone away**

Recommendations

Axioms of Public Communication

- Establish and maintain communication relationships with constituencies affected by regulator actions
- Improve the quality of these communication relationships, making them increasingly interactive or symmetrical

Recommendations

Threat of Opinion Spam

- Threats to legitimacy are real
 - Engaged people are going to comment and become more contentious
 - Aware people will become more discouraged
 - Carries reputational costs for federal agencies

Recommendations

Countering Opinion Spam in Soliciting Comments

- Direct trade-off between access and assurance
- Implement bot detection countermeasures
 - reCAPTCHA
 - Verified emails
 - Account creation
- Capture and monitor network traffic for spurts of submissions
- Use duplication detection tools
- Be transparent about opinion spam mitigation

Recommendations

Countering Opinion Spam in Comment Evaluation

- Modern AI aggregation and summarization tools are available
- AI use most palatable when paired with a human operator
- Be transparent about opinion spam mitigation
- AI use has not been subjected to legal review

Final Thoughts...

- In most cases, comments on regulations reflect people's attitudes and feelings about government actions in their lives.
They deserve respect
- Despite ideological differences, people I talked to are **trying to do the right thing**
 - Balancing entrenched, competing interests
 - Dealing with very complex problems
 - No easy answers
- **Preserve trust and legitimacy of rulemaking process**
